

POSBank Anyshop

The POSBank Anyshop touch screen was designed not solely by the manufacturer, but by a combination of prospective purchasers who already sold touch screens and required a specific specification.

Price is simply not always the total criteria but it is the usual criteria that many purchasers of EPoS equipment apply when buying such terminals.

The POSBank Anyshop and Imprex screens feature a die-cast frame and stand meaning these are heavy-duty compared to competitors units.

The cabinet power supply is a separate unit, not on the main PCB and includes a built in surge protector incorporated in the power pack. There is also an automated recovery system which restore windows back to factory default if it becomes corrupt, saving the end user time, hassle and money!

Although a pole display for the customer is available, a clip in integral rear display featuring larger VFD digits than normal is a neater and more stylist solution.

The Anyshop and Imprex can be specifically built to suit individual needs and applications, i.e. dallas keys, MSR, Chip & Pin, Sage line 50 link, web interface link to merge stock control to your website.

A 12" rear LCD display for promo videos and customer display is available as an option.

Units are available in Black, White, Red and Blue.
